1. Introduction

We introduced FlexAPI for the fast evolving IoT applications, which highly value easy integration, openness, flexibility, extensibility and programmability.

FlexAPI is designed to be efficient, clean and ready to use. It's network oriented and programming language independent, and is ideal for application integration inside the vehicle.

FlexAPI provides unified data and control service via REST API for LAN access.

For data service, we have ready to use reserved groups such as: GNSS, OBD, Motion, IO and Summary.

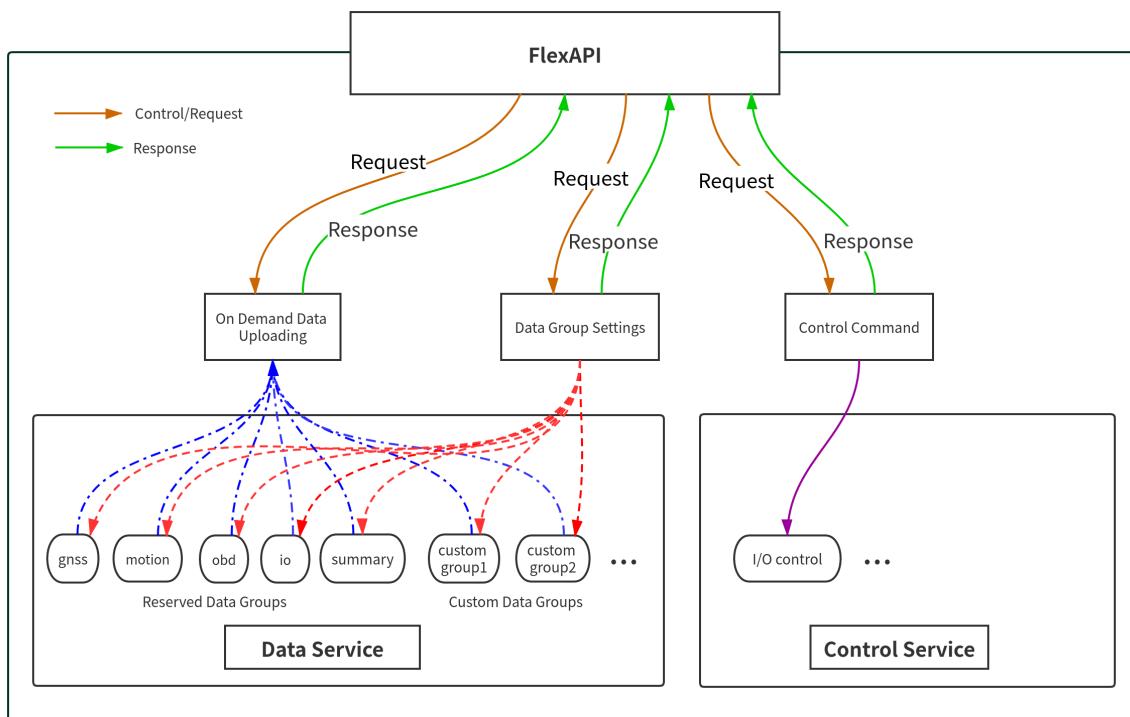

Note that the Summary group is the all in one data group which includes all the data from our reserved OBD, GNSS, Motion and IO groups.

In general, reserved groups are enough for user's need.

FlexAPI also provides REST API for users to apply control, such as turn on/off the digital output.

For advanced users, they can even define their interested groups.

1.1 Architecture

1.2 REST API Introduction

REpresentational State Transfer (REST) is an architectural style that defines a set of constraints to be used for creating web services. **REST API** is a way of accessing the web services in a simple and flexible way without having any processing.

1.3 REST API settings

REST API is disabled by default, you need to enable it first on VG710 for your subsequent service access.

The screenshot shows the 'REST API Management' section of a configuration interface. It includes fields for 'Enable' (set to 'localhost & LAN'), 'Localhost Listen Address' (http://127.0.0.1:5432), 'LAN Listen Address' (https://10.5.16.33:60000), 'LAN Access Token' (I7B2U0Nm7Oz5E1E4AWCzgudn7q4l0C32 with a 'Refresh Token' link), 'Include Invalid Data' (unchecked checkbox), and a 'FlexAPI Config File' section with 'Import', 'Export', and 'Restore default configuration' buttons.

- **Enable:** Options include **None**, **localhost** and **localhost & LAN**.
- **Localhost Listen Address:** Server settings for APPs run on VG710
- **LAN Listen Address:** Server settings for APPs within VG710 LAN
- **LAN Access Token:** Required **ONLY** for **Bearer** authentication in HTTP header for LAN Access.
- **Include Invalid Data:** if enabled, FlexAPI will also return invalid data items with `null` value besides valid data items.
- **FlexAPI Config File:** Manage FlexAPI configuration file of REST API

2 FlexAPI Overview

FlexAPI organizes data as groups and provides ready to use reserved groups for users to develop their applications.

FlexAPI allow users to change reserved and custom group settings.

This overview part gives summary on: FlexAPI general information, error codes and supported REST APIs.

For Basic Usage, see [3. Basic usage](#).

For Advanced Usage, see [4. Advanced usage](#).

For FlexAPI supported Parameters, see [Appendix A. FlexAPI supported Parameters](#).

3.1 Reserved group settings

3.1.1 General settings

Parameter Name	Description	Type	Range	Units	Optional	Note
interest	<p>interest parameter List of interested item, each item is represented as key: alias. alias is used in reported messages to rewrite key, a value of "" means no alias.</p> <p>For example, set interest with alias:</p> <pre>{"obd.mil": "MIL", "obd.dtcs": "dtcNum"}</pre> <p>reported data: {"MIL": "1", "dtcNum": "3"}</p> <p>set interest without alias:</p> <pre>{"obd.mil": "", "obd.dtcs": ""}</pre> <p>reported data:</p> <pre>{"obd.mil": "1", "obd.dtcs": "3"}</pre>	object			optional	<p>'key': FlexAPI Supported parameters</p> <p>'alias': parameter alias</p> <p>OBD group, see OBD Parameters</p> <p>GNSS group, see GNSS Parameters</p> <p>Motion group, see Motion Parameters</p> <p>IO group, see IO Parameters</p>

For both reserved and custom groups, you can redefine your interested data, simply use the following API to specify your interested data items using `interest` parameter.
