1. Introduction

We introduced FlexAPI for the fast evolving IoT applications, which highly value easy integration, openness, flexibility, extensibility and programmability.

FlexAPI is designed to be efficient, clean and ready to use. It's network oriented and programming language independent, and is ideal for application integration inside the vehicle(Edge computing).

FlexAPI provides unified data and control services via MQTT topics for LAN access.

For data service, each MQTT topic corresponds to a group of data, and we have ready to use reserved groups such as: GNSS, OBD, Motion, IO and Summary.

Note that the Summary group is the all in one data group which includes all the data from our reserved OBD, GNSS, Motion and IO groups.

In general, reserved groups are enough for user's need.

Users can subscribe to these topics to get the latest data, and they can also set the data uploading intervals.

FlexAPI also provides MQTT topics for users to apply control, such as turn on/off the digital output.

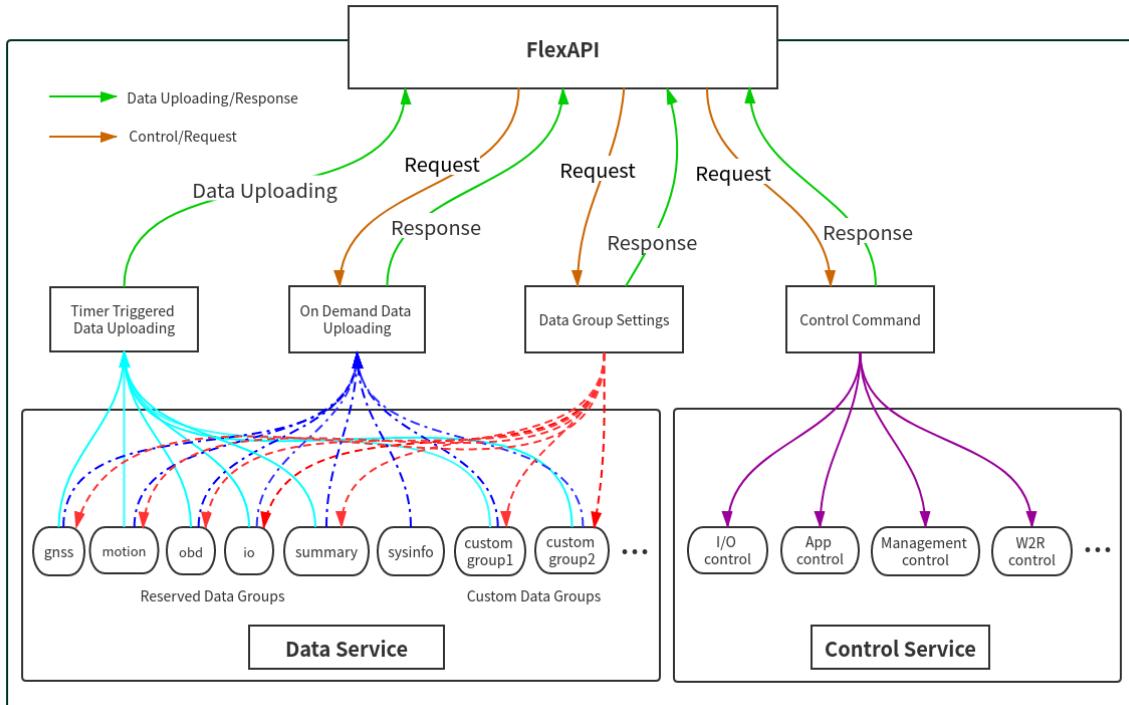

FlexAPI specially provides MQTT topics for users to actively get data on demand.

For advanced users, they can even define their interested groups and set their uploading intervals.

We employ a request & response scheme for user initiated service requests.

Request & response scheme means users need to subscribe to the response topics, and they request service by publishing a message to the request topics.

1.1 Architecture

1.2 MQTT Intro

MQTT is a widely adopted, lightweight messaging protocol designed for constrained devices.

Our MQTT implementation is based on MQTT version 3.1.1, and supports QoS 0 and 1.

For more information, see [MQTT](#).

1.3 MQTT Topics Rules

- Topics are `UTF-8` encoded hierarchical strings. The forward slash (/) is used to separate levels in the topic hierarchy.
- Topic Wildcards:

| Wildcard | Description |
|----------|--|
| # | Must be the last character in the topic to which you are subscribing. Works as a wildcard by matching the current tree and all subtrees. For example, a subscription to Sensor/# receives messages published to Sensor/, Sensor/temp,Sensor/temp/room1, but not the messages published to Sensor. |
| + | Matches exactly one item in the topic hierarchy. For example, a subscription to Sensor/+/room1 receives messages published to Sensor/temp/room1,Sensor/moisture/room1, but not the messages published to Sensor/room1. |

1.4 MQTT Broker settings

1.4.1 MQTT Broker address and port.

The local MQTT broker runs on LAN interface(Bridge 1) and listens on port 1085.

1.4.2 MQTT Authentication(Optional)

MQTT client can connect to MQTT broker with username and password pairs or anonymous, it's up to user's choice.

1.4.2.1 Username/Password

In this case, local MQTT broker requires an username and password pairs for authentication.

After a network connection is established by a client to broker, the first packet sent from the client to the broker MUST be a CONNECT packet

The payload must contain username, password and unique client identifier fields. see [MQTT CONNECT](#).

2 FlexAPI Overview

FlexAPI organizes data as groups and provides ready to use reserved groups for users to develop their applications.

FlexAPI allow users to change reserved and custom group settings.

Users can get timer triggered group data periodically. Besides, FlexAPI also allow users to actively get group data on demand.

For user initiated service requests we employ a request & response scheme.

Request & response scheme means users need to subscribe to the response topics, and they request service by publishing a message to the request topics.

This overview part gives summary on: FlexAPI general information, error codes and supported topics.

For Basic Usage, see [3. Basic usage](#).

For Advanced Usage, see [4. Advanced usage](#).

For FlexAPI supported Parameters, see [Appendix A. FlexAPI supported Parameters](#).

| error | error code | string | When the request fails, it is added to the response message body. For more information, see General Error Codes |
| error_desc | error description | string | When the request fails, it is added to the response message body. For more information, see General Error Codes |

| Parameter Name | Description | Type | Range | Units | Optional | Note |
|----------------|---|--------|----------|-------|-----------|---|
| client_token | A unique string for users to match responses with the corresponding requests. | string | | | mandatory | |
| interval | uploading interval | int | [0,3600] | s | optional | 0: disable timer upload |
| interest | <p>interest parameter</p> <p>List of interested item, each item is represented as key: alias. alias is used in reported messages to rewrite key, a value of "" means no alias.</p> <p>For example, set interest with alias:</p> <pre>{"obd.mil": "MIL", "obd.dtcs": "dtcNum"}</pre> <p>reported data:</p> <pre>{"MIL": "1", "dtcNum": "3"}</pre> <p>set interest without alias:</p> <pre>{"obd.mil": "", "obd.dtcs": ""}</pre> <p>reported data:</p> <pre>{"obd.mil": "1", "obd.dtcs": "3"}</pre> | object | | | optional | <p>'key': FlexAPI Supported parameters</p> <p>'alias': parameter alias OBD group, see OBD Parameters</p> <p>GNSS group, see GNSS Parameters</p> <p>Motion group, see Motion Parameters</p> <p>IO group, see IO Parameters</p> |

For `interval` and `interest` parameters, there are four use cases which apply to both reserved and custom groups.

Case 1. Disable group data uploading

Specify only `interval` field and set its value to 0 in message body.

4 }
```

Response Topic : `v1/{group_name}/set/resp`
